Optical Dual Link DVI Module

- Fiber Detachable Connection System of Dual Link DVI -

Description

The M1-3R2VI-DU DVI Module is a new member of the Opticis family of products that stretches your DVI/HDMI connectivity. It offers a fiber-optic long-distance extension of dual link DVI connectors. DDC connection is implemented over a CAT5e cable with RJ-45C.

The reality of high-speed digital graphic interconnections mandates products to maintain video quality and cost effectiveness of integrated display systems. Optical technology for gigabit digital transmission makes it simple to extend digital graphic data above the extension limits of copper wires providing pure signal integrity for an ideal visual experience, no EMI/RFI emissions, light weight, rugged cabling and connectors, low power consumption and installation ease.

The extension system consists of transmitter and receiver module boxes with female dual link DVI-D plugs, being able to connect PCs (Media Receiver) and displays (Monitor or HDTV) by dual link DVI-D copper cables respectively. Two (2) duplex LC patch cord fiber cables enable to transmit graphic data seven (7) channels including a clock.

The module also provides self- EDID programming feature that makes pure optical interconnection realized. It makes installation of M1-3REVI-DU much easier and more flexible at any displays of various resolution types. The module extends DVI dual link data of WQXGA (2560 x 1600) at 60Hz up to 2km (6,560feet) with virtual DDC.

The shipping group is shown as follows;

- 1) Transmitter, Receiver: 1SET

Functions

- Self-EDID Function

The EDID in a display can be read and restored by just plugging it to the display. This self-EDID programming feature makes the installation of M1-3R2VI-DU more easy and flexible at any variable resolution display systems.

- Power Save Mode in Transmitter Module

The laser diodes work only when +5V voltage should be supplied into the 14-pin in DVI connectors, that is, detecting plugging the DVI plug to the PC. The voltage passing through a regulator from the +5V PC power or external power has LD drive circuit work.

- Signal Detect Mode in Receiver Module

It offers squelch function blocking output signals when optical input power is lower than as specified in a certain case, that is, detecting losing the LC fiber-optic patch cord.
